## Risk of transplant failure controlled for known confounders

[The Risk of Transplant Failure With HLA Mismatch in First Adult Kidney Allografts From Deceased Donors](#)

Williams, Robert C.; Opelz, Gerhard; McGarvey, Chelsea J.; Weil, E. Jennifer; Chakkerla, Harini A.

Transplantation100(5):1094-1102, May 2016.

doi: 10.1097/TP.0000000000001115

Cox multivariate regressions were performed with the survival time of kidney allografts from deceased donors as the dependent variable and HLA mismatch as the primary explanatory variable with 0 mismatch as the reference. Blue diamonds represent the observed HRs for HLA mismatch for a reduced model with age, sex, and transplant era as covariates, whereas the red squares represent the observed HR values for the full model as presented in Table 2. The solid blue line is the fitted line for the reduced model with an intercept of 1.02 (0.98, 1.07),  $P < 0.0001$ , and a slope of 0.16 (0.15, 0.17),  $P < 0.0001$ , while the red line is fitted to the full model observed values with intercept of 1.04 (0.98, 1.10),  $P < 0.0001$ , and slope of 0.11 (0.09, 0.12),  $P < 0.0001$ . Error bars are the 95% confidence intervals for the respective points on the fitted lines.

# Scenario

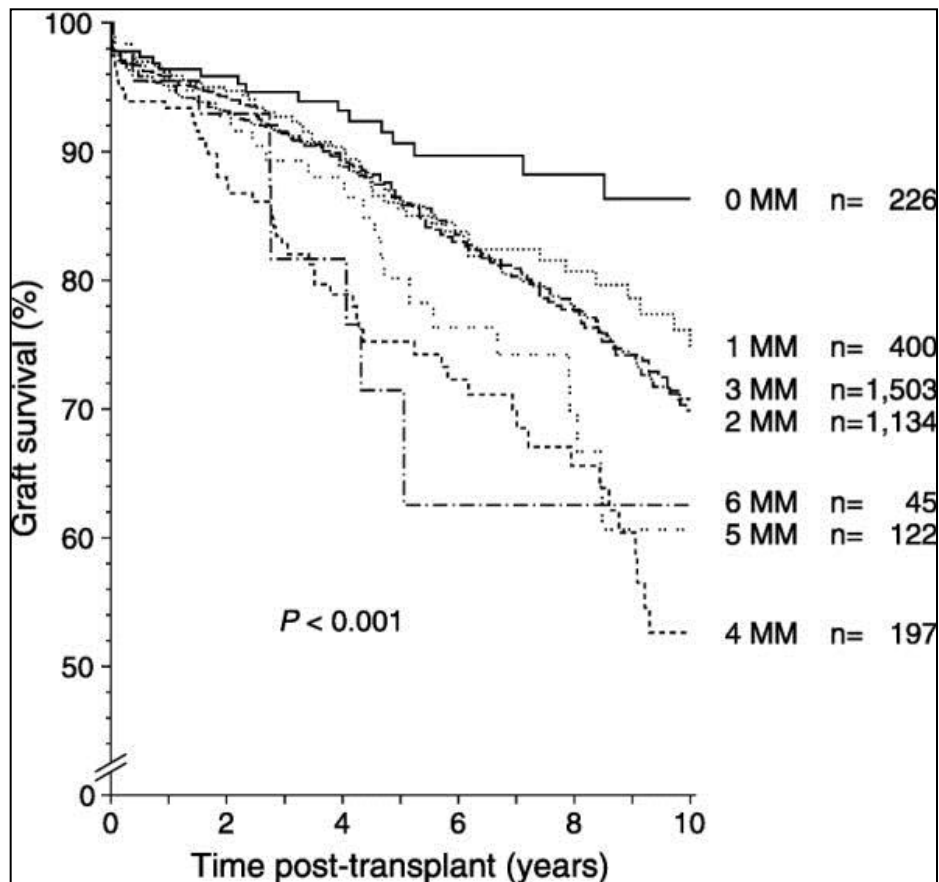

- 10 yr old Roy
  - PUV, bilateral VUR and dysplasia
  - Crea 600, Urea 33, K6, growth faltering
  - On the waiting list for 3 months
- Single mum, lorry driver, 3 other kids
- Uncle, 50
  - 2,2,1 mismatch, blood group compatible
  - Generally fit and well (BMI 29)

# What to do?

- LRD from uncle (HD in interim)?
- Try paired exchange?
- Something else?

# HLA mismatch in paediatric living donors

## HLA Matching in Pediatric Kidney Transplantation: HLA Poorly Matched Living Donor Transplants Versus HLA Well-Matched Deceased Donor Transplants.

Opelz G; Dohler B; Middleton D; Susal C; A Collaborative Transplant Study Report

Transplantation. 101(11):2789-2792, 2017 Nov.  
DOI: 10.1097/TP.0000000000001811

FIGURE 1 . Influence of HLA-A+B+DR matching on graft survival of first pediatric kidney transplants from LDs performed 2000 to 2015 (log rank P value with trend). Sum of HLA-A, -B, -DR MMs between donor and recipient were added for analysis.

# Living donor v Deceased donor

## HLA Matching in Pediatric Kidney Transplantation: HLA Poorly Matched Living Donor Transplants Versus HLA Well-Matched Deceased Donor Transplants.

DOI: 10.1097/TP.0000000000001811

FIGURE 3 . Graft survival of first pediatric kidney transplants. Comparison of well-matched DD grafts (0-1 MM DD) with good (1-3 MM LD) and poorly (4-6 MM LD) matched LD grafts. P values for log rank test of Kaplan-Meier analysis.

# More detailed HLA matching using Eplets

# Eplet v Antigen matching for HLA-DR and DQ

Years of Follow-up

Years of Follow-up

# Impact of HLA MM on waiting time for 2<sup>nd</sup> transplant

	0	1	2	5	10
0-1 MM ———	146	104	66	21	8
2-3 MM .....	698	504	393	191	70
4-6 MM - . - . -	1654	1293	1002	470	172

# Immunosuppression burden

# Summary

- Increased HLA MM directly and proportionally increases the risk of graft failure
  - Deceased Donor and Living Donor
- Failed transplants with increased MM have higher sensitisation and longer waiting times
- **YES! HLA matching matters in children**

“Remember to look up at the stars and not down at your feet. Try to make sense of what you see and wonder about what makes the universe exist. Be curious. And however difficult life may seem, there is always something you can do and succeed at. It matters that you don't just give up.”

Stephen Hawking, 1942 ~ 2018
